

# Stormwater Management Program

Dear Village Residents, Business Owners and Visitors:

On March 10, 2003, the Village of Scarsdale began the development of its Stormwater Management Plan, mandated by the United States Department of Environmental Protection and administered by the New York State Department of Environmental Conservation. The plan requires that the Village make every effort to improve the water quality of its streams, lakes and rivers. The Village must implement six (6) minimum control measures including educating the public, soliciting participation and involvement of the public, detection and elimination of illicit discharges, control of construction site runoff, maintenance and operation of post construction structural Best Management Practices and pollution prevention and good housekeeping at municipal facilities.

Recognizing the need for improving the quality of our surface waters, the Village passed legislation in the initial stages of its Stormwater Management Program, designed to control the quantity and quality of runoff from new development and redevelopment, and ensure that stormwater runoff from a project, once completed, created minimal or no impact on water quality. Scarsdale has been a proponent of maintaining and improving water quality. Learn what you can about improving stormwater quality by visiting the following websites:
